GDB QUICK REFERENCE GDB Version 5

Essential Commands

 gdb program [core]
 debug program [using coredump core]

 b [file:]function
 set breakpoint at function [in file]

 run [arglist]
 start your program [with arglist]

 bt
 backtrace: display program stack

 p expr
 display the value of an expression

 c
 continue running your program

 n
 next line, stepping over function calls

 s
 next line, stepping into function calls

Starting GDB

 gdb
 start GDB, with no debugging files

 gdb program
 begin debugging program

 gdb program core
 debug coredump core produced by program

gdb --help describe command line options

Stopping GDB

Getting Help

run

help list classes of commands

help class one-line descriptions for commands in

class

help command describe command

Executing your Program

run arglist start your program with arglist

start your program with current argument

list

run ... <inf >outf start your program with input, output

redirected

kill kill running program

tty dev use dev as stdin and stdout for next run

set args arglist specify arglist for next run set args specify empty argument list

show args display argument list

show env show all environment variables
show env var
show env var
show value of environment variable var

set env var string set environment variable var unset env var remove var from environment

Shell Commands

 ${\tt cd} \ dir \\ {\tt change working directory to} \ dir \\$

pwd Print working directory

(c)1998,2000 Free Software Foundation, Inc.

make ... call "make

shell cmd execute arbitrary shell command string

surround optional arguments ... show one or more arguments

Permissions on back

Breakpoints and Watchpoints

break [file:]line set breakpoint at line number in file eg: break main.c:37 b [file:] line break [file:]func set breakpoint at func in file break + offsetset break at offset lines from current stop break -offset break * addrset breakpoint at address addr break set breakpoint at next instruction break ... if exprbreak conditionally on nonzero expr cond n expr new conditional expression on breakpoint n; make unconditional if no exprtbreak ... temporary break; disable when reached rbreak regex break on all functions matching regex watch exprset a watchpoint for expression expr catch event break at event, which may be catch. throw, exec. fork, vfork, load, or unload. info break show defined breakpoints info watch show defined watchpoints

clear delete breakpoints at next instruction clear [file:] fun delete breakpoints at entry to fun() clear [file:] line delete breakpoints on source line delete [n] delete breakpoints [n] for breakpoint [n]

 $\begin{array}{ll} \textbf{disable} \ [n] & \textbf{disable} \ \text{breakpoints} \ [\text{or breakpoint} \ n] \\ \textbf{enable} \ [n] & \textbf{enable} \ \text{breakpoints} \ [\text{or breakpoint} \ n] \\ \textbf{enable} \ \text{once} \ [n] & \textbf{enable} \ \text{breakpoints} \ [\text{or breakpoint} \ n]; \\ \textbf{disable} \ \text{again} \ \text{when} \ \text{reached} \\ \end{array}$

enable del [n] enable breakpoints [or breakpoint n]; delete when reached

ignore n count ignore breakpoint n, count times

 $\begin{array}{ll} \textbf{commands} \ n & \textbf{execute GDB} \ command-list \ \textbf{every time} \\ \textbf{[silent]} & \textbf{breakpoint} \ n \ \textbf{is reached.} \ \textbf{[silent]} \\ command-list & \textbf{suppresses default display]} \end{array}$

end end of command-list

Program Stack

backtrace [n]print trace of all frames in stack; or of nframes—innermost if n>0, outermost if bt [n]n<0 frame [n]select frame number n or frame at address n; if no n, display current frame up nselect frame n frames up down nselect frame n frames down info frame |addr|describe selected frame, or frame at addr info args arguments of selected frame info locals local variables of selected frame register values [for regs rn] in selected info reg |rn|... frame; all-reg includes floating point info all-reg [rn]

Execution Control

	101 01
$\begin{array}{c} \texttt{continue} \ \left[count \right] \\ \texttt{c} \ \left[count \right] \end{array}$	continue running; if $count$ specified, ignore this breakpoint next $count$ times
$\begin{array}{l} \mathtt{step} \ \left[count \right] \\ \mathtt{s} \ \left[count \right] \end{array}$	execute until another line reached; repeat $count\ {\rm times}$ if specified
$\begin{array}{l} \mathtt{stepi} \ \left[count \right] \\ \mathtt{si} \ \left[count \right] \end{array}$	step by machine instructions rather than source lines
$\begin{array}{l} \mathtt{next} \ \left[count \right] \\ \mathtt{n} \ \left[count \right] \end{array}$	execute next line, including any function calls
$egin{aligned} \mathtt{nexti} & [count] \ \mathtt{ni} & [count] \end{aligned}$	next machine instruction rather than source line
${\tt until} \ igl[location igr]$	run until next instruction (or location)
finish	run until selected stack frame returns
$\texttt{return} \ \left[expr \right]$	pop selected stack frame without executing [setting return value]
${\tt signal} \ num$	resume execution with signal s (none if 0)
$\mathtt{jump}\ line$	resume execution at specified $line$ number
jump * address	or address
set var=expr	evaluate expr without displaying it; use for altering program variables

Display

print [/f] [expr]	show value of expr [or last value \$]
p [/f] [expr]	according to format f :
X	hexadecimal
d	signed decimal
u	unsigned decimal
0	octal
t	binary
a	address, absolute and relative
С	character
f	floating point
$\mathtt{call} \ ig[/fig] \ expr$	like print but does not display void
x [/Nuf] expr	examine memory at address <i>expr</i> ; optional format spec follows slash
N	count of how many units to display
u	unit size; one of
	b individual bytes
	h halfwords (two bytes)
	w words (four bytes)
	g giant words (eight bytes)
f	printing format. Any print format, or
	s null-terminated string
	i machine instructions
$ exttt{disassem} \left[addr ight]$	display memory as machine instructions

Automatic Display

$\mathtt{display} \; \big[/f\big] \; expr$	show value of $expr$ each time program stops [according to format f]
display	display all enabled expressions on list
$\verb"undisplay" n$	remove number(s) n from list of
	automatically displayed expressions
$\hbox{\tt disable disp } n$	disable display for expression(s) number a
$\verb"enable disp" n$	enable display for expression(s) number n
info display	numbered list of display expressions

Expressions

expran expression in C, C++, or Modula-2 (including function calls), or: addr @lenan array of len elements beginning at file::nma variable or function nm defined in file $\{type\}addr$ read memory at addr as specified type most recent displayed value \$nnth displayed value \$\$ displayed value previous to \$ \$\$nnth displayed value back from \$ \$_ last address examined with x \$__ value at address \$_ \$var convenience variable; assign any value

show last 10 values or surrounding n

display all convenience variables

Symbol Table

show values |n|

show conv

info address sshow where symbol s is stored info func [regex] show names, types of defined functions (all, or matching regex) info var | regex | show names, types of global variables (all, or matching regex) whatis |expr|show data type of expr or \$ without evaluating; ptype gives more detail ptype [expr] ptype type describe type, struct, union, or enum

GDB Scripts

source script read, execute GDB commands from file $define \ cmd$ create new GDB command cmd; execute command-list script defined by command-list

end end of command-list $document \ cmd$ create online documentation for new GDB command cmd help-textend of help-text

Signals

handle signal act specify GDB actions for signal: print announce signal noprint be silent for signal stop halt execution on signal nostop do not halt execution pass allow your program to handle signal do not allow your program to see signal nopass info signals show table of signals, GDB action for each

Debugging Targets

target type param connect to target machine, process, or file help target display available targets attach param connect to another process detach release target from GDB control

Controlling GDB set param value set one of GDB's internal parameters display current setting of parameter show param Parameters understood by set and show: complaint limit number of messages on unusual symbols confirm on/off enable or disable cautionary queries editing on/offcontrol readline command-line editing height lppnumber of lines before pause in display language lang Language for GDB expressions (auto. c or modula-2) listsize nnumber of lines shown by list ${\tt prompt} \ str$ use str as GDB prompt radix base octal, decimal, or hex number representation verbose on/off control messages when loading symbols width cplnumber of characters before line folded write on/off Allow or forbid patching binary, core files (when reopened with exec or core) groups with the following options: history ... h ... h exp off/on disable/enable readline history expansion h file filename file for recording GDB command history h size size number of commands kept in history list h save off/on control use of external file for command print ... groups with the following options: р... p address on/off print memory addresses in stacks, values

p array off/on compact or attractive format for arrays p demangl on/off source (demangled) or internal form for C++ symbols

p asm-dem on/off demangle C++ symbols in machineinstruction output p elements limit number of array elements to display

p object on/off print C++ derived types for objects p pretty off/on struct display: compact or indented

p union on/off display of union members

p vtbl off/on display of C++ virtual function tables

show commands show last 10 commands show commands n

show 10 commands around number n

show commands + show next 10 commands

Working Files

file [file] use file for both symbols and executable; with no arg, discard both core [file] read file as coredump; or discard exec [file] use file as executable only; or discard symbol [file] use symbol table from file; or discard load file dynamically link file and add its symbols add-sym file addr read additional symbols from file. dynamically loaded at addr info files display working files and targets in use path dirs add dirs to front of path searched for executable and symbol files show path display executable and symbol file path info share list names of shared libraries currently loaded

Source Files

dir names add directory names to front of source dir clear source path show dir show current source path list show next ten lines of source list show previous ten lines list lines display source surrounding lines, specified file: num line number in named file [file:] function beginning of function in named file +off off lines after last printed -offoff lines previous to last printed *addressline containing address list f, lfrom line f to line linfo line numshow starting, ending addresses of compiled code for source line num info source show name of current source file info sources list all source files in use forw regex search following source lines for regex rev regex search preceding source lines for regex

GDB under GNU Emacs

M-x gdb run GDB under Emacs C-h m describe GDB mode M-s step one line (step) M-nnext line (next)

M-istep one instruction (stepi) C-c C-f finish current stack frame (finish)

M-ccontinue (cont) M-u

up arg frames (up) M-ddown ara frames (down)

C-x & copy number from point, insert at end C-x SPC (in source file) set break at point
